Wireframe Document

A wireframe document is a visual representation or schematic blueprint that outlines the layout, structure, and functionality of a user interface (UI) or a web page. It is typically a low-fidelity, simplified diagram or sketch that serves as a foundational design document during the early stages of a software or web development project. Wireframes are used to communicate and visualize the placement of various elements, such as buttons, menus, content blocks, and interactive features, without delving into detailed design aspects like color, fonts, or graphics.

Wireframes serve as a crucial communication tool among project stakeholders, including designers, developers, product managers, and clients. They help ensure a shared understanding of the user interface's structure and functionality before investing time and resources into high-fidelity design and development.
